Foreward

The 2024/25 Kenya Census of Agriculture (KCA) aims to collect comprehensive data and generate estimates for key agricultural indicators in Kenya. This census targets households and institutions involved in agriculture across the country and is conducted by the Kenya National Bureau of Statistics (KNBS) in partnership with the Ministry of Agriculture and Livestock Development and other key stakeholders.

Following international guidelines, it is advisable to conduct a pilot survey before the main data collection exercise. The pilot survey is designed to test the effectiveness of the survey tools, estimate time and cost requirements, and identify potential challenges for the main fieldwork. The KNBS conducted a pilot survey for the census between February and May 2024. This report outlines the implementation of the pilot survey, the logistics involved, key issues encountered, and recommendations for the main survey.

The Kenya National Bureau of Statistics extends its gratitude to all households and institutions that participated in the pilot survey, providing crucial data and information that contributed to the success of the exercise. Special thanks go to the staff members from KNBS, the Ministry of Agriculture and Livestock Development, and the State Department for Fisheries, Aquaculture, and The Blue Economy for their invaluable contributions to preparing the survey instruments and executing the pilot survey. Additionally, the Bureau expresses its appreciation to all stakeholders who played a critical role in the implementation of the 2024/25 KCA Pilot, offering technical and financial support during planning, data collection, and report writing. In particular, the Bureau is grateful to the World Bank for the financial support received under the Eastern African Regional Statistics Program for Results (EARSP for R) to undertake this activity.

Finally, sincere appreciation goes to the Government of Kenya for providing an enabling environment that allows the Bureau to effectively discharge its mandate. We trust that the information provided in this pilot survey report will lay a solid foundation for the successful implementation of the 2024/25 main Census of Agriculture.

Macdonald G. Obudho, PhD, EBS, MBS
Director General

Chapter: 1

Introduction

1.1 Background

The Kenya National Bureau of Statistics is mandated to collect, analyze, and disseminate official statistics in line with international standards and methods. These statistics are mainly used to support economic planning, evidence-based decisions, and informed policies. To improve the quality and reliability of official statistics, key sector statistics should be collected and managed under the National Strategy for Development of Statistics (NSDS) within the framework of National Statistical Systems (NSS). Agriculture statistics is one of the key sector statistics under the NSDS and NSS, hence requiring support from KNBS.

Agriculture is the cornerstone of the Kenyan economy contributing approximately 21.8 per cent to the Gross Domestic Product (GDP) in 2023. The sector employs more than 40 per cent of the total population and about 60 per cent of the rural population. It is a critical source of livelihood and foreign exchange earnings. Despite its importance, the development and transformation of the agricultural sector is highly affected by lack of adequate, reliable data. The agricultural sector has several indicators, including Social Development Goals(SDGs) and Comprehensive Africa Agriculture Development Programme(CAADP) indicators that are not fully captured and reported. Over the years, the quantity and quality of agricultural data in Kenya have been declining. Most of the available agricultural data are administrative data that are not collected through standard statistical procedures. Moreover, most of the data cover the input and output indicators but not the outcome and impacts indicators. In order to address these challenges, the Kenya National Bureau of Statistics (KNBS) plans to undertake a comprehensive Census of Agriculture from 2024 to 2025 in collaboration with the Ministry of Agriculture and Livestock Development (MoALD), followed by periodic sample surveys to ensure continuous data collection.

This initiative aligns with the current government's Bottom-Up Economic and Transformation Agenda (BETA), which prioritizes support for the agriculture sector. It is also in line with the Agricultural Sector Transformation and Growth Strategy (ASTGS 2019-2029), that places data and digitalization as the key enablers of the envisaged transformation.

The main objective of the KCA is to collect adequate and accurate agricultural data and statistics that will meet the needs of policy-makers, farmers and other stakeholders.

The specific objectives for KCA are to:

i. Provide benchmark data that can be used to improve crop, livestock, fisheries and agroforestry statistics.

ii. Monitor and evaluate the impact of policies, projects/ programs, and other farmer support services.

iii. Monitor the 2023-2027 fourth Medium Term Plan (MTP IV). The MTP IV has a handbook of monitorable agricultural indicators.

iv. Monitor agriculture performance at the county level since KCA will produce county-level statistics.

v. Monitor progress in achieving the Sustainable Development Goals (SDGs). Specifically, these will include SDG 2.3.1 on Volume of production per labour unit by classes of farming/pastoral/forestry enterprise size and SDG 2.3.2 on Average income of small-scale food producers, by sex and indigenous status.

vi. Facilitate transparent, evidence-based decisions and planning, and fair allocation of national resources for agricultural development.

vii. Support public policy analysis, debate and advice.

viii. Provide data to facilitate monitoring the progress of CAADP indicators which are varied and include selected agricultural production, inputs, prices, imports, etc.

ix. Support the monitoring and management of national food security.

x. Provide data required by policy-makers, farmers, researchers, private sector agencies, and other stakeholders.

xi. Generated information will be used to update the macro-economic aggregates in national accounts such as Agriculture Value Added among others.

Agriculture is the cornerstone of the Kenyan economy contributing approximately 21.8 per cent to the Gross Domestic Product (GDP) employing more than 40 per cent of the total population and about 60 per cent of the rural population.

Kenyan agriculture calendar runs from March to March of the following year. The annual agriculture production has two main seasons, namely:

01.

The Long Rains season that starts in March, April, May (MAM) begins around the 3rd week of March (onset) and continues to the 2nd or 3rd week of May (cessation). It has a peak (or peaks in some areas) between 1st week of April and the 1st week of May. At times the season may extend to the month of June in the areas around the coast and western parts of Kenya.

02.

The Short Rains season that starts in October, and rains through November to December (OND). These rains mark the second planting season in Kenya where farmers sow crops such as beans, peas, and vegetables among other crops.

The long rains usually have more rains and cover most parts of the country, while the short rains tend to be less intensive and most reliable for the lower eastern and coast regions.

In order to get comprehensive agricultural data, the KCA will be conducted separately for the long rains and short rains season as recommended by the Food and Agriculture Organization(FAO).

1.2 The KCA - Pilot Study

To conduct a comprehensive survey, there is a need for a pilot study in line with the standard practice. A pilot study is a small-scale, preliminary version of the main survey project conducted to evaluate the feasibility, time, cost, risk, and adverse events that could be involved in the full-scale undertaking of the main survey. In this regard, KNBS conducted a pilot in seven counties. The survey involved a sampling process. Before the sampling, KNBS carried out a household listing exercise in all the selected sampled EAs to create an up-to-date agricultural sampling frame. This frame provided a foundation for selecting a representative sample of agricultural units for data collection purposes, in this case, households engaged in agriculture. The sampling frame was well constituted ensuring all sampling units and stratification were adequately covered.

The pilot survey was conducted in 7 selected counties (Nyandarua, Kisii, Isiolo, Garissa, Kwale, Makueni and West-Pokot) over an 18-day period, from March 5th to 22nd March. The reference period for this pilot spanned from October 1st 2023, to February 29th 2024, aligning with the short rain season.

The findings from this pilot were crucial for refining the methodology and ensuring the successful implementation of the main census.

By conducting this pilot, KNBS aimed to capture comprehensive data on all establishments and households engaged in significant agricultural production activities thus providing a robust foundation for the KCA and subsequent sample surveys. The pilot exercise thus plays a pivotal role in enhancing the quality and reliability of agricultural statistics in Kenya.

The pilot survey was conducted in 7 selected counties (Nyandarua, Kisii, Isiolo, Garissa, Kwale, Makueni and West-Pokot) over an 18-day period.

1.3 Objectives of the KCA Pilot Study

The overall objective of the pilot study for the KCA is to test the logistics and quality of the instruments designed for the main census.
This broad objective is further detailed into specific goals as follows:

S/N	OBJECTIVE	DESCRIPTION	ACHIEVED/ NOT ACHIEVED
1.	**Testing Survey Instruments**	Evaluate the effectiveness, clarity, and comprehensiveness of the questionnaires (both PAPI and CAPI formats) and manuals used for data collection.	• The questionnaire generally elicited the desired information from respondents. • However, some questions needed clarification/ rephrasing to ensure they were understood uniformly by all respondents.
2.	**Sample Size Calculation**	Estimate the variability in the data, which is crucial for calculating the sample size needed for the main census. This will ensure that the survey is adequately powered to detect significant effects.	• The pilot survey provided valuable insights into the variability of the data across different variables of interest as intended. e.g. Value chains in different agro-ecological zones. • Variability was observed to be consistent with expectations or previous research findings.
3.	**Logistics Assessment**	Assess the logistical arrangements including the duration of the survey, transportation needs, budget allocation, and the adequacy of materials provided to theenumerators.	• The pilot survey provided insights into the time needed to complete data collection activities considering the average time taken to complete interviewing one household. • Transportation requirements for fieldwork activities were evaluated based on the geographic distribution of sampled EAs, accessibility of survey locations, and modes of transportation available which all proved adequate. • Budget allocations for various logistical aspects of the main survey were evaluated and recommendations for adjusting budget allocation for vehicle maintenance and fuel allocation in some counties were forwarded. • The adequacy of materials provided to enumerators, including survey instruments, training manual, data collection tools(tablets), and other resources, was evaluated and all proved to be efficient.
4.	**Training Evaluation**	Determine the sufficiency of the training programs for trainers, supervisors, and enumerators in terms of content delivery and practical application.	• Feedback from enumerators was collected to assess the clarity, relevance, and engagement level of training materials and presentations which gave positive feedback. • Areas where the manual was unclear were highlited and clarified.
5.	**Testing/ Refinement of Census Design**	Provide an opportunity to refine the survey design, and ensure that the main study is well-structured and methodologically sound.	• Evaluation of survey design elements such as sampling strategy, sequencing of questions, skips between sections, and data collection procedures was conducted to ensure methodological consistency.
6.	**Data Collection Process**	Observe and document the actual data collection process to identify any potential issues and areas for improvement.	• The pilot survey provided an opportunity to observe the actual data collection process in real-time and the dashboard on survey solutions software which proved efficient. • Potential issues or challenges encountered during data collection were documented and solutions provided adequately. • Data quality was assessed based on the completeness, accuracy, and consistency of responses collected during the pilot survey and areas of improvement discussed. • Insights from supervisors regarding their experiences, challenges, and suggestions for improvement were considered in evaluating the data collection process which provided valuable insights.
7.	**Feasibility**	Assess whether the methods and procedures for the planned survey are practical and workable when done for the census.	• Recommendations were made for improving the feasibility of conducting the censuss which includes adjustments to logistical plans, contingency measures for addressing weather-related disruptions, enhancements to community engagement and publicity strategies, and additional resource allocation as needed.

Chapter: 2

Survey Methodology

2.1. Survey Scope and Coverage

The data collection units for the survey were both households and institutions engaged in agricultural activities. The household component was designed to collect data on the indicators at the household level, while the institutional component was for the indicators at non-household, commercial, institutional, and specialty farms.

2.2. Sample Selection

The KCA pilot covered seven purposefully selected counties. The selection of the counties was informed by their agro-ecological zones as well as the agricultural practices of the natives. **Table 2.1** Indicates the details of the counties selected for KCA pilot survey.

Table 2.1: Counties by Agro-Ecological Zone and Main Activity

S/No	County	Agro-ecological Zone	Main Activity
1.	Kwale	Coastal lowlands	Fishing/Crops
2.	Kisii	Upper midlands	Crops
3.	Nyandarua	Upper highlands	Crops
4.	Makueni	Lower midlands	Crops/Livestock
5.	Isiolo	Inland lowlands	Livestock
6.	West Pokot	Inland lowlands	Crops/Livestock
7.	Garissa	Inland lowlands	Livestock

The pilot design followed the proposed design for the KCA and targeted both non-household farming institutions and farming households. For the household component, the pilot followed a two-stage stratified cluster sampling design whereby in the first stage, an equal number of 10 Enumeration Areas were purposefully identified for each of the seven counties. In the second selection stage, within the selected Primary Sampling Units (PSUs) a fixed take of 12 households were randomly selected to participate in the pilot.

Further, in line with the KCA sample design, all the 126 large and commercial farming households identified from within the selected PSUs were selected with a probability of one and therefore, all were enrolled in the survey.

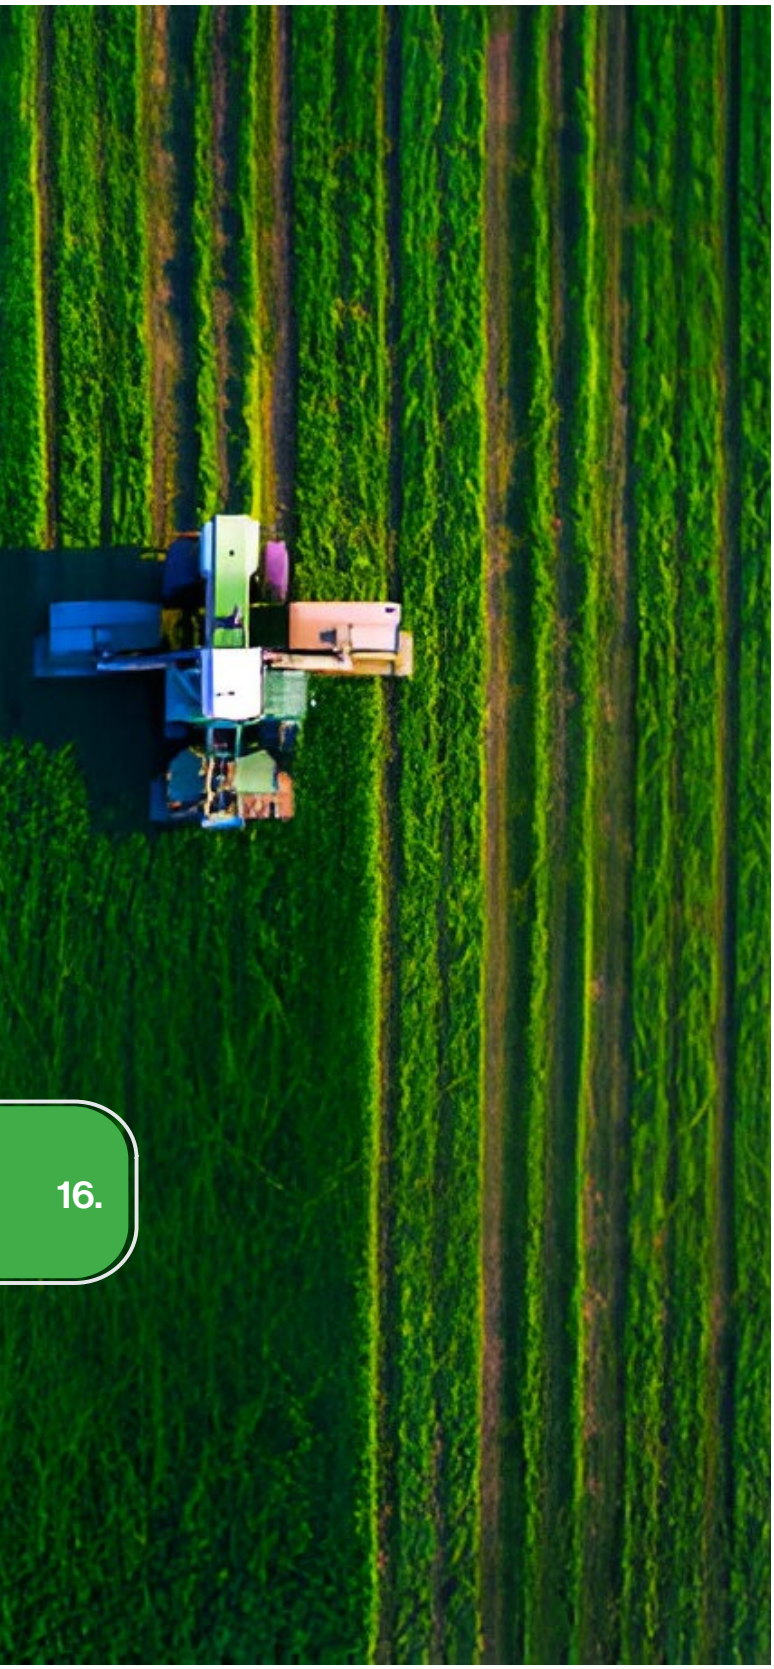

The PSUs selected for the pilot were identified based on the various aspects to be tested during the pilot, these included areas that engage in various agricultural enterprises to be covered in the survey, data transmission needs, and security requirements among others.

For the non-household farming institutions, the KCA design was that a complete enumeration will be undertaken in this sector, however, for the pilot four non-household farming institutions were also purposively selected for each of the seven counties participating in the pilot, the selection was informed by the type of agricultural enterprises undertaken by the institutions and which were of interest to the survey.

The pilot utilized two sampling frames, an area frame for the household component of the pilot survey and a list frame for the institutional component. The area frame was based on the list of enumeration areas developed for the 2019 Kenya Population and Housing Census. The identified EAs for the pilot were listed to create a sampling frame for the second stage selection of farming households. The list of institutions was obtained from the administrative data maintained by the Ministry of Agriculture, and Livestock Development.

The pilot design followed the proposed design for the KCA and targeted both non-household farming institutions and farming households.

The sampling frames were stratified by the agricultural enterprise before a sample was drawn.

2.3. Listing Exercise

To successfully carry out the pilot for the KCA survey, it was necessary to create a comprehensive household sampling frame that contains farming households in line with the proposed methodology for the KCA. This involved listing farming households and physically numbering structures within the selected Enumeration Areas (EAs). The household listing process was crucial as it laid the foundation for drawing a representative sample of farming households for use in the pilot census.

Household listing was therefore undertaken from 7th to 18th February 2024, a period of 12 days, to develop a sampling frame for the second stage selection of households. The main aim of the listing was to identify farming households which were the target population for the KCA pilot survey. The listing was also aimed at identifying large and commercial farms operated within the households which are to be fully enumerated as per the proposed sample design for the KCA survey. In addition, the listing aimed at capturing key auxiliary information for stratification of the sampling frame.

The household listing was done through a face-to-face interview using Computer Assisted Personal Interviews, the questionnaire was programmed in a survey solution system. The listing was fully computerized as the Enumeration Area maps were also digital interactive maps.

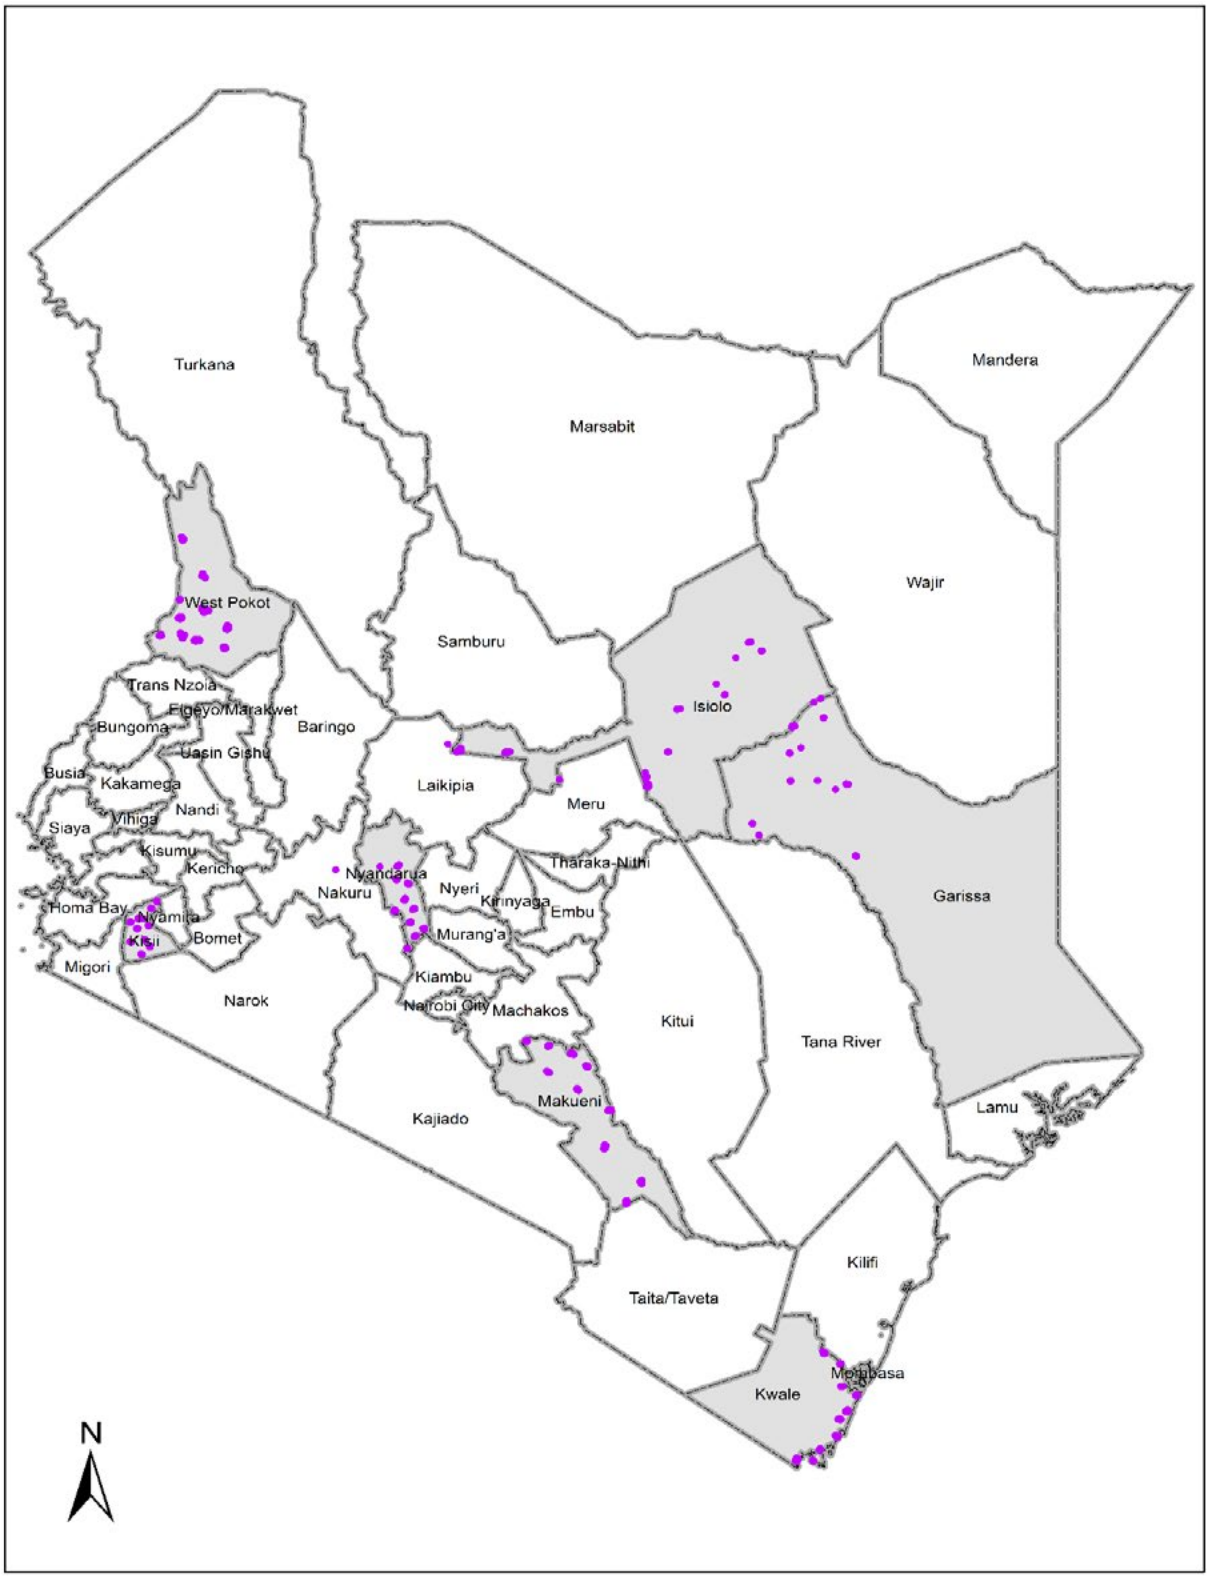

The quality of the data was being checked by the Cartography Division and support was being accorded to the team on a need and request basis. Pin locations for the large farms were picked and maps were made on need basis.

2.4 Large, Institutional and Commercial Frams

These non-household based farms were not to be listed. Instead their details already exist at the Ministry of Agriculture and county levels. These were provided during enumeration.

Extension staff based at the county level were used to guide the officers when locating the farms.

Figure 1: Map of Selected Counties for the KCA Pilot.

2.5. Survey Instruments

Survey instruments consisted of questionnaires and manuals provided to participants to facilitate data collection. The pilot employed two questionnaires designed for data collection which were administered to 12 households in each of the 10 Enumeration Areas, in each of the 7 selected counties, to gather feedback on various aspects of the survey instruments. These instruments included;

1. The Household questionnaire.
2. The Institutional questionnaire.
3. Training and instruction manuals.

The difference between the household questionnaire and the institutional questionnaire are the identification particulars, demographics and farm management. Other details remain similar in the two questionnaires.

The questionnaires covered the following thematic areas as shown in the annexed questionnaires:

1. Household / Institution Identification
2. Household Member Roster
3. Access to Credit, and Imports and Exports of Agricultural Services
4. Sources of Household Income
5. Labour Input
6. Land Tenure, Land Utilization and Legal Status
7. Forestry / Woodlot
8. Agricultural Technology and Extension Services
9. Means of Transportation and Storage Facilities
10. Irrigation Systems
11. Water Management Practices and Flooding / Water Retention
12. Crops Production and Productivity (Temporary and Permanent Crops)
13. Agricultural Inputs by Crops
14. Agricultural Equipment
15. Livestock Production
16. Livestock Inputs, Service Inputs and Grazing Practices
17. Fishing and Aquaculture
18. Household Food Security

Based on the feedback from the short rains pilot, necessary revisions have been made to address all issues related to question clarity, wording, and response options ensuring that the final survey instruments are well-designed and capable of generating valid and reliable data based on the variables of interest.

Appendix 1 shows the questionnaire administered during the pilot.

Survey instruments consisted of questionnaires and manuals provided to participants to facilitate data collection. The pilot employed two sets of questionnaires designed for data collection and these were administered to 12 households in each of the 10 Enumeration Areas.

Chapter: 3

Pilot Survey Implementation

3.1 Survey Personnel

(a) Listing personnel

The household listing exercise, in preparation for the KCA pilot survey, was carried out in the 7 sampled counties. Each county had two teams which comprised of one Supervisor (Team Leader), 4 Enumerators, and a driver. The team was selected from experienced KNBS staff with expertise in sampling procedures and technical household listing expertise to ensure the sample that was selected was adequate. This team was supported by Cartographers, Sampling Division Staff, and Regional Coordinators who ensured the exercise was conducted smoothly.

(b) Pilot survey personnel

The pilot survey was conducted by a team of KNBS staff carefully selected for their expertise and experience in data collection methodologies.

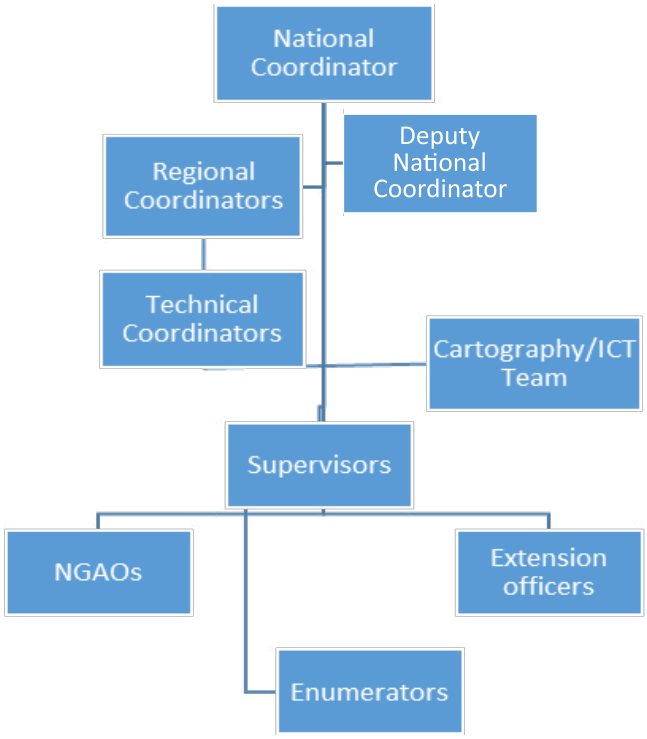

The pilot survey teams consisted of four officers; the Supervisor (Team Leader), two Enumerators, and a driver. In addition, the teams were supported by a team responsible for quality control at the KNBS headquarters and regional field coordinators who were from KNBS, the Ministry of Agriculture and Livestock Development and Ministry of Mining, Blue Economy and Maritime Affairs(State Department for Blue Economy anad Fisheries).

The Enumerators were responsible for collecting data through structured interviews using CAPI, while the Supervisors oversaw and guided their teams to ensure tasks are completed efficiently and effectively. In addition, they ensured adherence to survey protocols, data quality standards, and timely completion of assigned tasks in the field during the 18 days of fieldwork.

Quality control team and Cartographers were tasked with monitoring data collection processes, conducting spot checks, and providing feedback to field teams to ensure the quality and accuracy of collected data.

The Regional and Technical Coordinators ensured the smooth execution of the exercise by handling any technical, administrative, and logistical challenges during the fieldwork.

Figure 2: Team Organization Chart

3.2 Training of the Pilot Survey Personnel

The staff selected to undertake the pilot exercise were thoroughly trained on the various survey instruments for a period of 14 days. The training entailed going through the hard copy questionnaire alongside the manual before embarking on the soft copy questionnaire in the CAPI system and last activity was fieldwork practice.

The survey personnel were trained in various interviewing techniques to improve their approach and communication with respondents. This was to ensure effective communication as it enhances the quality of data collected and coverage.

3.3 EA Identification and map use

The success of survey data collection is heavily dependent on the accurate identification of target households. EA identification was facilitated through the use of Geographic Information Systems (GIS) and detailed maps of the survey area which had earlier been developed by the KNBS Cartography team during the 2019 Kenya Population and Housing Census (KPHC). This technology enabled the delineation of EAs based on predefined criteria such as administrative boundaries, agro-economic zones, and main farming activity. This provided conclusive sampled Enumeration Areas (EAs) for use during the data collection period.

Maps served as valuable visual aids for field teams, guiding them to the sampled EAs and minimizing navigational challenges during data collection.

These maps featured essential functionalities such as;

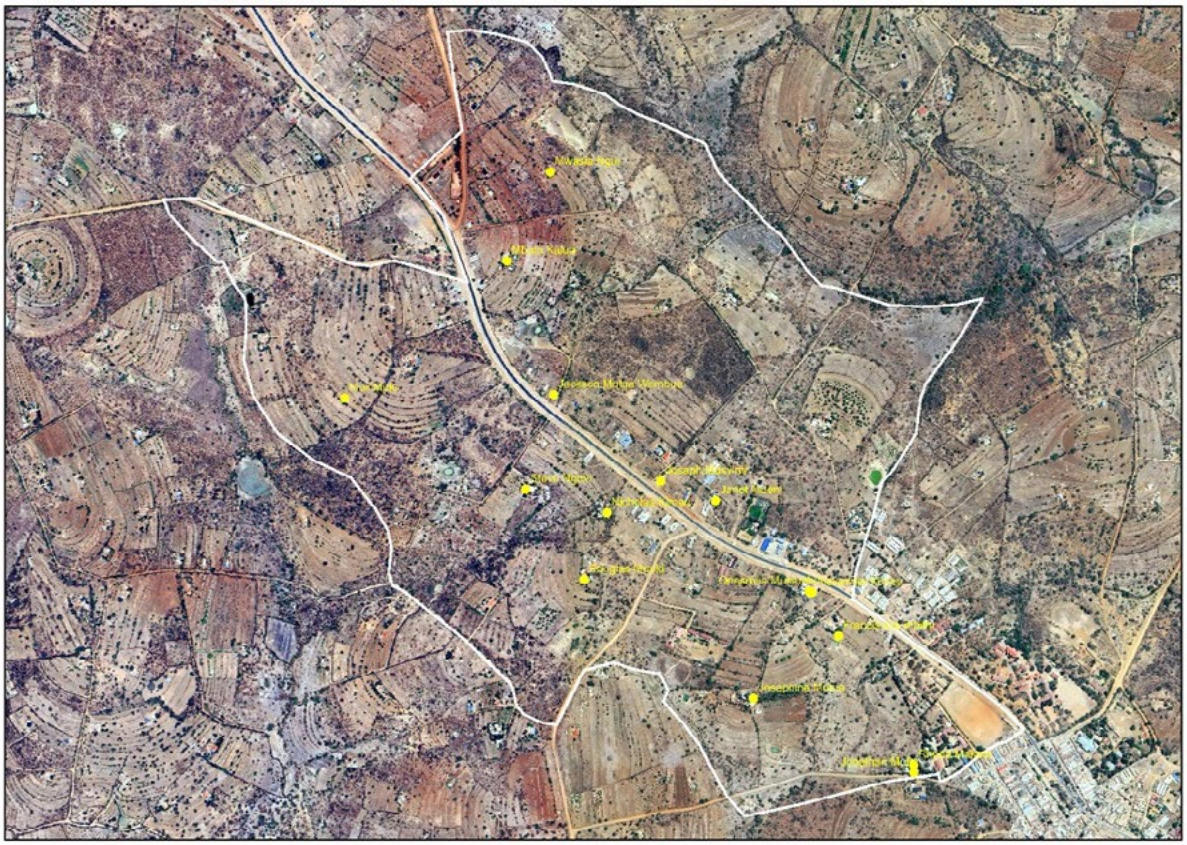

- Zooming
- Panning
- Locator (to pinpoint the exact location within the map)

The maps had a centroid to guide teams, facilitating precise navigation to the selected Enumeration Area.

During the exercise, the presence and involvement of National Government Administration Officers (NGAOs), especially village elders, proved to be very helpful in identifying the EAs and selected households.

Figure 3: Enumeration Area Map

3.4 Data Collection

The Pilot fieldwork for the KCA for Agriculture took place between 5th to 22nd March 2024, a period of 18 days. The reference period for the pilot was 1st October 2023 to 29th February 2024.

The pilot listing exercise and the pilot survey adopted Computer Aided Personal Interview (CAPI) data collection method. The interviews were conducted face to face. The Household and Institutional questionnaires were programmed using survey solutions to form the two CAPI data collection tools. The interviewers were issued with tablets and trained on how to use the survey solutions application to collect the data. A pretest of the system was done during the training of interviewers in both activities to test the flow of the questionnaire, the skip patterns and validation checks. The CAPI issues identified during the pretest were corrected which ensured minimal data collection errors.

Supervisors and Interviewers were issued with unique usernames and passwords as an additional measure to protect collected data. Each interviewer was assigned specific households in the form of assignments. These assignments were loaded into their specific account names in readiness for data collection. The assignments included a centroid variable that assisted in EA identification. Once the interviewer completed an interview, the supervisor was required to go check and approve if satisfied with the quality of data collected otherwise reject the interview for error correction.

There was a dedicated server for the listing and pilot exercises that stored the collected data. This ensured efficient data backup and guaranteed data security.

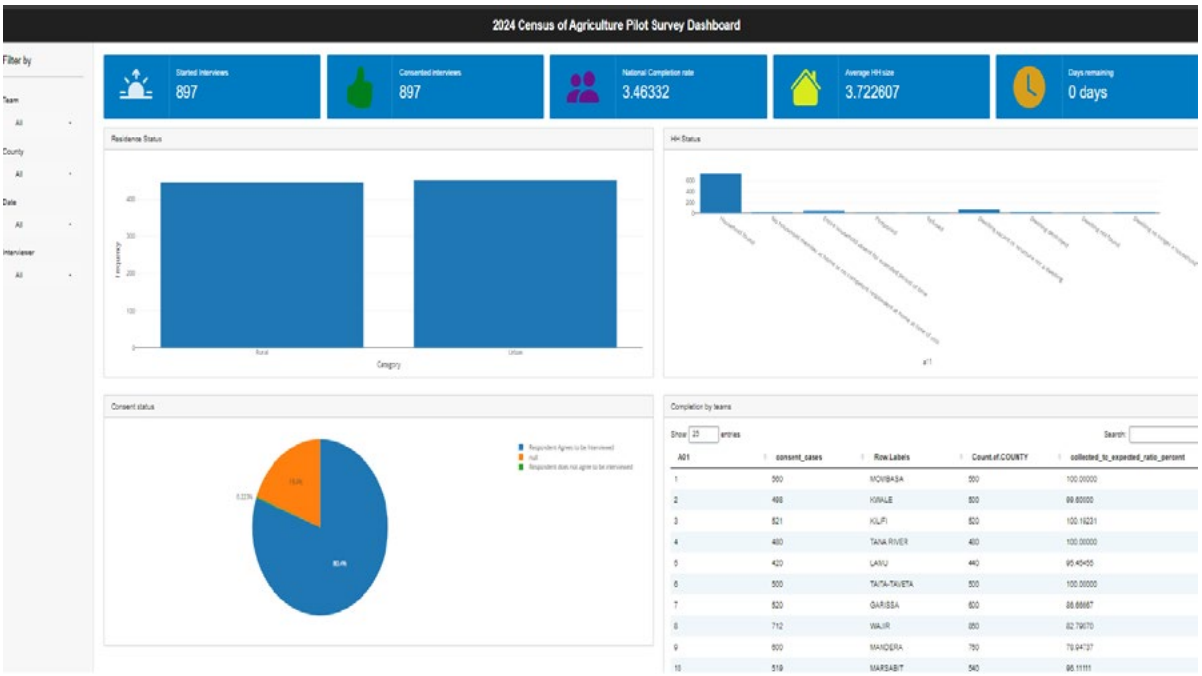

3.5 Data Quality Control

A system of data review and monitoring was designed using R programming language. The system combined a back-end aspect of data review and a front-end aspect of a dashboard. The back-end system uses an API (Application Programming Interface) to automatically download data from the server, and merge the various versions and modules to form a complete dataset. The system then uses a predetermined set of indicator queries and processes them to inspect for errors. The observations with errors are exported as an MS Excel document where the assigned field teams are required to address the errors before leaving that EA.

The front-end of the system is a dashboard that shows real time basic statistics such as coverage, days remaining, interviews status, completion rate. All these indicators on the dashboard are filtered by national and county level, team, interviewer and date.

The data control aspect ensures early detection and correction before data collection is over significantly improving the quality of collected data.

Figure 4: Dashboard

The data control aspect ensures early detection and correction before data collection is over significantly improving the quality of collected data.

3.6 Findings

A total of 1,120 assignments were assigned to interviews in 7 counties comprising of households, large and commercial farms and institutional farms.

Table 3.1: Number of Assigned Households, Large/ Commercial Farms and Institutions, by County.

County	Number of Households	Large and commercial	Institutional firms	Total
Garissa	120	19	4	143
Isiolo	120	20	4	144
Kisii	120	12	4	136
Kwale	120	14	4	138
Makueni	120	23	4	147
Nyandarua	120	12	4	136
West Pokot	120	26	4	150
Grand Total	**840**	**126**	**28**	**994**

(a) Response Rate

The overall interview response rate stood at 96.9 percent

Table 3.2: KCA Interview Results and Response Rate

Interview results	Freq.	Percent
Household located, contacted, and interviewed	812	84.1
Household located, contacted, and partially interviewed	2	0.2
Household located, contacted, asked to return later	5	0.6
No household member at home	1	0.1
No competent respondent at home at time	5	0.5
Entire household absent for extended period	13	1.3
Eligible	**838**	**86.7**
Dwelling vacant	4	0.4
Dwelling destroyed	6	0.6
Dwelling not found	5	0.5
Available household member is incapacitited	1	0.1
Ineligible	**16**	**1.7**
UnAccounted	**112**	**11.6**
Total	**966**	**100**
Response rate		**96.9**

(b) Completion by county

West Pokot County had the highest completion rate of the covered households accounting for 16.4% followed by Makueni County, 16.0% with Garissa and Isiolo County having the least coverage percentage of 11.5% and 11.8% respectively.

Table 3.3: Completion Status by County

County	No of HHs	Percent
Garissa	93	11.5
Isiolo	96	11.8
Kisii	118	14.5
Kwale	123	15.2
Makueni	130	16.0
Nyandarua	119	14.7
West Pokot	133	16.4
Total	**812**	**100**

(c) Time taken to complete interview

On average, an interviewer took an average of 1 hour 30 minutes to complete the household questionnaire and 01:03:57 for the institutional questionnaire.

Table 3.4: Duration of Interview by County

County	Average Duration(Minutes)
Garissa	133.2
Isiolo	80.8
Kisii	63.9
Kwale	105.6
Makueni	108.8
Nyandarua	55.4
West Pokot	63.8
Overall	**87.4**

3.7 Pilot survey findings – Institutions

Table 3.9 shows distribution of sampled institutions by county. An equal number of institutions were interviewed except for Isiolo and Nyandarua county.

Table 3.6: Distribution of Institutions by County

County	Frequency	Percent
Garissa	4	16
Isiolo	2	8
Kisii	4	16
Kwale	4	16
Makueni	4	16
Nyandarua	3	12
West Pokot	4	16
Total	**25**	**100**

(a) Interview status

As shown in Table 3.10 most large farms/institutions were located during the pilot period.located.

Table 3.7: Interview Status of Institutions

Visit Outcome	Frequency	Percent
Establishment found	22	88
Establishment vacant	1	4
Establishment destroyed	2	8
Total	**25**	**100**

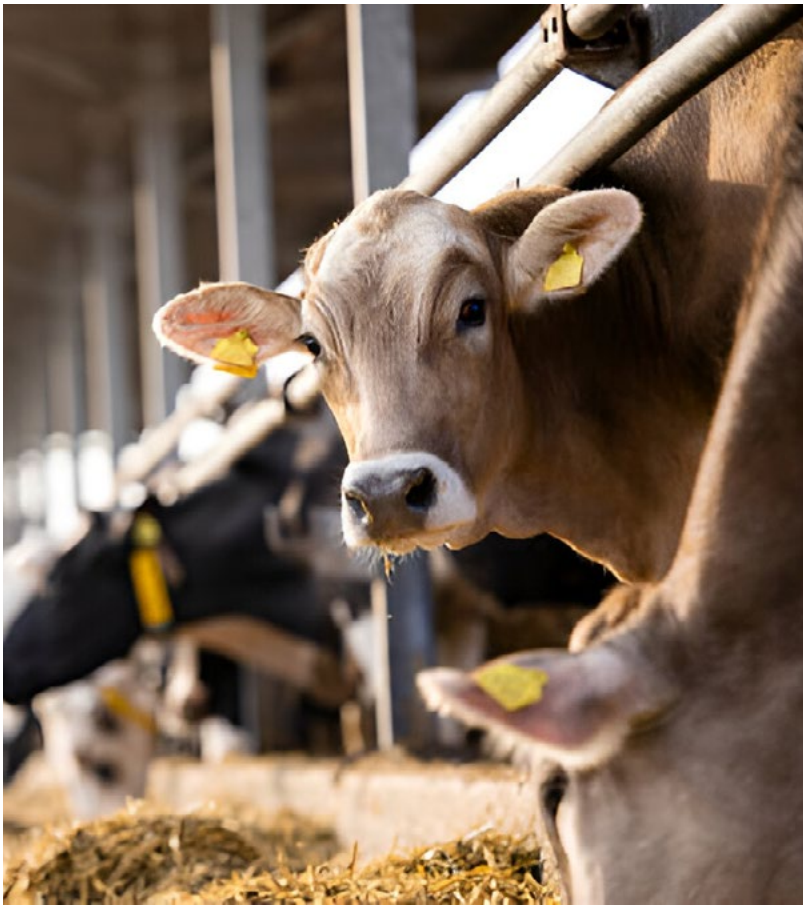

(b) Completion status

During the pilot survey, 71.4 per cent of the institutions were located and interviews conducted while another 14.3 per cent were located and partially interviewed.

Table 3.8: Completion Status of Institutions

Interview results	Frequency	Percent
Located, contacted, and interviewed	15	71.43
Located, contacted and partialy interviwed	3	14.29
Establishment vacant	1	4.76
Establishment destroyed	2	9.52

Chapter: 4

Logistics

4.1 Communication

Effective team communication was vital to the success of the pilot survey. Daily briefings at headquarters and within the teams in the field ensured a smooth flow of information, enabled error correction, and allowed for quick responses to challenges. The teams created WhatsApp groups for instant communication, making it easy to share information quickly. Additionally, field personnel could call coordinators to discuss challenges and receive recommended solutions.

4.2 Extension Officers Roles

The support provided by the Extension Officers, who are stationed at the County Headquarters, was commendable. They assisted the teams in locating the Institutions and Large Farms allocated to the teams. However, not all teams utilized them due to delays in communication and or due to communication breakdown on how team leaders could reach the county extension officers. To address this, there is need to emphasize their roles in the main census and also provide a contact person e.g. county directors, at respective counties and link them with the field data collection teams.

4.3 Coordination of NGAOs

Coordination with National Government Administrative Officers (NGAOs) contributed to smooth collaboration between data collection teams and the respondents thereby fostering good community engagement. The Village Elders assisted in locating the selected households once the teams arrived at the selected Enumeration Areas. They were also helpful in introducing the teams to the respondents, which resulted in a good response rate.

4.4 Transport

The teams were allocated drivers with vehicles to enable their movement during the data collection period. The vehicles had fuel and maintenance allocation. This enabled the teams to cover the EAs allocated to them. However, it was noted that in subsequent surveys there was need to consider some increase in the budget allocation in fuel and maintenance for some counties due to their vastness and terrain.

4.5 Budget

Financial management adhered to the budgetary framework during the pilot survey which ensured efficient resource utilization. A review of fuel and maintenance allocations in some counties and timely disbursement of funds is advised to optimize fieldwork operations.

4.6 Access to Households and Institutions

Access to households was generally smooth, but challenges were encountered when gaining entry to some institutions. Issues included closures, relocations, and requirements for official letters and prior notification for visits. To improve institutional access, it is recommended to establish prior communication channels, especially for institutions with specific entry protocols.

The support provided by the Extension Officers, who are stationed at the County Headquarters, was commendable. They assisted the teams in locating the Institutions and Large Farms allocated to the teams.

Chapter: 5

Challenges, Recommendations, Lessons learned and Resolutions

5.1 Challenges and Recommendations

Outlined below are the challenges reported by the teams after the pilot survey, along with recommendations for subsequent KCA exercises.

S/NO	Challenge	Details	Recommendation
1.	**Difficulty in obtaining information from the institutions**	• Some of the institutions required formal introductory letters and prior notice about the survey and its objectives before interviews could be conducted. This was experienced in all the sampled counties.	• Ensure that formal introductory letters and notifications are sent in advance to all sampled institutions ahead of the census to inform them about the activity and its objectives to facilitate smooth data collection.
2.	Poor Publicity about the exercise among households	• Some farmers in Makueni County were initially reluctant to provide information, confusing the survey with other exercises. Other farmers feared that their information was being collected so that the government could tax them.	• Conduct public sensitization campaigns before the census to explain its purpose and alleviate any confusion or resistance among farmers.
3.	Transport	• Some of the Enumeration Areas (EAs) in Garissa, Makueni, Isiolo, West Pokot and Kwale Counties were inaccessible due to poor feeder roads, causing delays in commencing work. • The vastness of some Enumeration Areas in Isiolo County had sampled households located far from each other, making it time-consuming to move between households and traversing the areas.	• Allocate extra time for enumerators working in particularly vast or difficult-to-access EAs to ensure they can complete their tasks without undue pressure. • Additionally, deploy additional resources, such as motorcycles or off-road vehicles to facilitate easier and quicker movement in vast and challenging terrains.
4.	Adverse Weather Conditions	• Adverse Weather Conditions such as high temperatures in Isiolo and Garissa County caused overheating of tablets that affected the performance of tablets. Cloudy conditions and rain in Kisii County affected GPS accuracy and the working schedule.	• Provide field teams with protective equipment such as gumboots, umbrellas and bag pack for carrying the gadgets. • Allocate additional data collection days in regions where heavy rains are likely to disrupt the work schedule.
5.	Insecurity in some areas which affected data collection	• Insecurity in Isiolo county for instant cattle rustling in Loruko EA posed a threat to the exercise. • Land Disputes in Garissa: Insecurity in Abdille Lugey and Dujis EAs due to ongoing land disputes; security personnel were required.	• Engage security personnel to accompany field teams in high-risk areas to ensure their safety during the survey. • Similarly, employ security personnel to provide protection in regions with ongoing land disputes to allow the survey to proceed without threats.

The data control aspect ensures early detection and correction before data collection is over significantly improving the quality of collected data.

5.2 Lessons learned and resolutions

1. From the pilot exercise, it was resolved that the household identification system will be assigned to KNBS county staff who will act as EA guides. The guides will undergo a short training during the main survey training on the system and will assist the field teams in identifying sampled enumeration areas and households.
2. To address the confusion arising from listing institutions, large farms, and commercial farms, it is crucial to clarify how the listing teams should differentiate them. This will prevent the data collection teams from mistakenly visiting institutions that are actually individually owned or large farms that do not engage in large-scale agricultural activities as seen in the pilot survey.
3. Establish clear criteria to define who qualifies as a farmer, ensuring research assistants have a better understanding as they conduct interviews.

2024_25 KENYA CENSUS of Agriculture Pilot

HOUSEHOLD QUESTIONNAIRE

THIS SURVEY IS BEING CONDUCTED BY THE KENYA NATIONAL BUREAU OF STATISTICS AS MANDATED BY THE STATISTICS ACT (ACT 2006 OF THE LAWS OF KENYA)

THIS INFORMATION IS STRICTLY CONFIDENTIAL AND IS TO BE USED FOR STATISTICAL PURPOSES ONLY.

GENERAL INFORMATION AND INSTRUCTIONS

1. Legal Mandate/ Authority

Kenya National Bureau of Statistics (KNBS) is established as a State Corporation by an Act of Parliament, the Statistics Act No. 4 of 2006 (Rev. 2019),

2. Confidentiality

The information provided in the questionnaire by households will be treated with confidentiality and used strictly for statistical purposes only.

3. Objective

The main objective of the 2024/2025 Kenya Census of Agriculture is to provide up to date statistics on Agricultural sector, which will inform and monitor policies, and to develop a framework for continuous monitoring of the Agriculture sector in Kenya.

4. Target respondent

All Households in Kenya, which are engaged in Agricultural activities are required to complete this questionnaire.

5 .Survey Reference Period

The information required is for the calendar year 2023.

6. Correspondence

All sections of the questionnaire must be completed. Any parts, which may not be applicable, should be indicated as "not applicable". Any correspondence relating to the questionnaire or any other issue concerning the 2024/2025 Kenya Census of Agriculture should be addressed to either:

The Director General,

Kenya National Bureau of Statistics

Real Towers, Hospital Road, Upperhill

P.O Box 30266- 00100 Nairobi, Kenya

Tel: +254- 735-004-401/ +254-202-911-000

Web - www.knbs.or.ke

Email- info@knbs.or.ke

7. Other Comments

In case you have any comments or information relating to the data provided, please insert them in the comment box found at the end of the questionnaire.

HOUSEHOLD QUESTIONNAIRE

Introduction and Consent

"Greetings!

Hello, my name is _____.
I work for the Kenya National Bureau of Statistics in collecting data that the Government of Kenya and other stakeholders will use for planning purposes. I am visiting you in connection with the pilot for 2024_25 Kenya Census of Agriculture that is being conducted in 7 counties. The Survey seeks to get up to date statistics on the Agricultural Sector to inform Agricultural policies and development in Kenya. The information you provide will be treated in confidence and pooled with that from other institutions in the country for use in formulation of suitable programmes and policies to promote our country's economy.

CONFIDENTIAL
KENYA NATIONAL BUREAU OF STATISTICS
2024/25 KENYA CENSUS OF AGRICULTURE PILOT
